ACKNOWLEDGEMENT

First and foremost, we would like to express our sincere gratitude to our supervisor, Er. Basanta Subedi, for his continuous guidance, encouragement, and valuable suggestions throughout the development of this project. His technical expertise and constructive feedback played a vital role in shaping the SportsBoard system.

We are also thankful to Er. Krishna Ghimire, Chief of Research Management Cell, along with all the lecturers and staff members of Pokhara Engineering College for providing the necessary academic support, resources, and guidance required to complete this project.

We would like to acknowledge the collective effort and dedication of the project team members- Alisha Baral, Anuja Lamichhane and Sheeksha Kaji Baral. The successful completion of this project is the result of effective teamwork, collaboration, and mutual support.

Finally, we extend our sincere thanks to Pokhara Engineering College for providing the infrastructure, technical facilities, and learning environment necessary for project development. We look forward to further enhancing the SportsBoard system and successfully completing the project.

ABSTRACT WITH KEYWORDS

The project report entitled “SportsBoard: All Sports, One Board” is designed to provide a centralized digital platform for managing sports-related information, events, news, and user interactions. This system aims to overcome the limitations of traditional manual and scattered sports information systems by offering an efficient web-based solution.

SportsBoard enables users to view upcoming sports events, schedules, match details, and sports news in real time. It also allows organizers and administrators to manage events, publish announcements, handle player selection applications, and manage ticket sales through a structured database system. By using modern web technologies, SportsBoard improves accessibility, accuracy, and efficiency in sports event management.

CHAPTER 1 INTRODUCTION

1.1 BACKGROUND

Our project entitled “SportsBoard” is a web-based system designed to provide information about sports matches, events, and related activities in Nepal. The existing method of sharing sports information is mostly manual and scattered across social media, posters, and informal channels, which makes it difficult for users to get accurate and timely updates.

SportsBoard is developed to partially computerize the work performed by sports organizers. The system allows organizers and administrators to post match details, schedules, and news, while users can view events, apply for player selections, and book tickets online.

i. Social Aspect:

The system brings sports players, fans, and organizers together on a single platform. It encourages sports participation and helps build a strong sports community in Nepal.

ii. Economic Aspect:

The system supports online ticket booking and event promotion, which helps increase revenue for organizers and reduces manual operational costs.

iii. Geographical Aspect:

The system can be accessed from any part of Nepal, including remote areas, making sports information widely available.

1.2 STATEMENT OF PROBLEM

The traditional system of managing sports events in Nepal is inefficient and unorganized. Sports information is scattered and there is no single platform for match updates, player selection, and ticket booking. Most processes are manual, time-consuming, and error-prone.

The major drawbacks of the existing system are:

i. No centralized platform for sports matches updates and news.

ii. Manual and inefficient player selection process.

iii. Offline and inconvenient ticket booking system.

iv. Difficulty in managing events and participants manually.

1.3 OBJECTIVES

The main objectives of the SportsBoard project are:

i. The system aims to provide a single online platform where users can easily find information about sports events, matches, schedules, and news instead of searching through different sources.

ii. The system enables players to submit their applications for sports team selections through an online form, making the process faster and more organized.

iii. Users can book tickets for sports events through the platform and make online payments, which reduces manual ticket selling and improves convenience.

iv. The system provides tools for organizers to create events, manage player applications, update match details, and publish announcements easily.

1.4 SCOPE OF PROJECT

The scope of the project is to develop an online platform that helps manage sports events and activities efficiently. It allows organizers to create tournaments, manage teams, schedule matches, and handle registrations through a digital system. Users can easily view event details, register for competitions, and make payments through integrated online payment systems such as Khalti. Administrators can manage content, users, and events through an admin panel. Overall, the system aims to reduce manual work, improve event organization, and make sports management easier for both organizers and participants.

1.5 LIMITATIONS

The SportsBoard system has the following limitations:

i. The system depends on internet connectivity.

ii. Online payment and news relies on third-party services.

iii. Users with low technical knowledge may face difficulties.

iv. Initially, the system may support limited sports categories.

CHAPTER 2 LITERATURE REVIEW

2.1 PRELIMINARY STUDY OF PROJECT

“SportsBoard” addresses the need for a structured and digital sports event management platform that connects players, sports organizers, and audiences through a centralized system. Traditional sports event management in many regions relies on manual registration, social media announcements, and scattered information sources. These methods often cause problems such as delayed communication, inefficient player registration, and lack of proper event records.

The preliminary study identifies that traditional sports event management systems lack:

• A centralized platform for sports event information

• Online player registration and application systems

• Integrated ticket booking and payment features

• Efficient event scheduling and match management

• Real-time updates for sports news and results

The SportsBoard system aims to solve these problems by providing an integrated web-based platform that simplifies sports event management and improves accessibility for users and organizers.

2.2 SIMILAR EXISTING SYSTEMS

Digital platforms have transformed sports management by enabling online updates, event organization, and fan engagement. Many online systems provide sports information, event updates, and ticket booking services that help improve communication between sports organizations and audiences. To identify the limitations of current systems and understand existing solutions, several platforms relevant to the proposed SportsBoard system were reviewed.

2.2.1 ESPN

ESPN is a global sports media platform that provides live scores, match schedules, sports news, and real-time notifications to users. It demonstrates an effective system for centralized sports information delivery and strong user engagement through digital media. The platform allows fans to follow their favorite teams and events easily. However, ESPN mainly focuses on sports broadcasting and journalism and does not support athlete registration, event organization, or local sports tournament management functionalities.

2.2.2 EVENTBRITE

Eventbrite is an international event management and ticketing platform that allows organizers to create events, manage registrations, and sell tickets online. The platform is widely used for conferences, concerts, and community events, providing efficient booking and event promotion services. However, Eventbrite is designed for general-purpose event management and does not include sports-specific workflows such as player selection, team coordination, or tournament scheduling.

2.2.3 ANFA

All Nepal Football Association operates the official website that publishes football-related news, tournament schedules, and official announcements in Nepal. It serves as an important source of sports information for football players and fans. However, the platform mainly provides informational content and lacks integrated online participation systems such as player registration, event applications, and ticket booking features.

2.2.4 CricHQ

CricHQ is a cricket management platform that provides tools for live scoring, tournament management, and player statistics. It allows organizers to manage cricket matches and tournaments digitally while enabling fans to view live scores and match details. However, CricHQ mainly focuses on cricket and does not support multiple sports event management within a single platform.

Research Gap

The review of existing systems shows that current platforms mainly focus on either sports journalism or general event ticketing services. These systems do not provide a unified platform specifically designed for managing sports events, player registrations, and ticket bookings together. Therefore, there is a clear need for a centralized sports management system tailored to local sports communities.

2.3 CONCLUSION

The literature review highlights the growing significance of digital platforms in the sports domain, emphasizing the need for centralized management of sports events, player data, and organizational information. Existing studies reveal gaps in accessibility, real-time updates, and user engagement in traditional systems, underscoring the potential of web-based solutions. Various technologies, frameworks, and approaches—ranging from relational databases to modern web development tools—have been evaluated for their effectiveness in addressing these challenges. This review establishes a foundation for developing SportsBoard, a comprehensive platform that integrates scheduling, registration, and performance tracking, aiming to enhance efficiency, transparency, and user experience in sports management.

CHAPTER 3 SYSTEM ANALYSIS

3.1 REQUIREMENT ANALYSIS

Requirement analysis is the process of identifying the resources and conditions needed for the successful development and operation of the system. For the SportsBoard system, requirements include both software and hardware components required to develop, run, and maintain the application efficiently.

3.1.1 SOFTWARE REQUIREMENT

The SportsBoard system requires several software tools and technologies for development and operation.

i. Operating System: Windows, Linux, or macOS
ii. Programming Language: Python
iii. Framework: Django
iv. Frontend Technologies: HTML, CSS, JavaScript
v. Database Management System: SQLite
vi. Code Editor / IDE: Visual Studio Code
vii. Modeling Tool: Draw.io
viii. Version Control: Git and GitHub
ix. Web Browser: Google Chrome, Mozilla Firefox, or Microsoft Edge

These software tools help in building the web application, managing data, and ensuring smooth system functionality.

3.1.2 HARDWARE REQUIREMENT

The SportsBoard system can run on standard computer hardware with the following minimum requirements:

i. Processor: Intel Core i3 or higher
ii. RAM: Minimum 4 GB (8 GB recommended)
iii. Storage: At least 20 GB free disk space
iv. Display: Standard monitor with internet browser support
v. Internet Connection: Required for accessing the web application

These hardware requirements are sufficient for both development and basic deployment of the system.

3.2 FEASIBILITY ANALYSIS

Feasibility analysis evaluates whether the proposed system is practical and beneficial to implement. The SportsBoard system was analyzed based on technical, economic, schedule, and legal feasibility.

3.2.1 TECHNICAL FEASIBILITY

The SportsBoard system is technically feasible because it uses widely available technologies such as Python and the Django framework. These technologies are reliable, scalable, and well-supported by large developer communities.

The system can be developed using standard computing resources and can run on commonly used web browsers. Therefore, the technical requirements for implementing the system are easily achievable.

3.2.2 ECONOMIC FEASIBILITY

The project is economically feasible because it mainly uses open-source technologies such as Python, Django, and SQLite. These tools do not require expensive licensing fees. Most of the development tools are freely available, which reduces overall project costs. Therefore, the system can be developed and maintained with minimal financial investment.

3.2.3 SCHEDULE FEASIBILITY

The project schedule was carefully planned to ensure completion within the given academic timeline. The development process included stages such as problem identification, system design, coding, testing, and documentation.

With proper planning and teamwork among the project members, the SportsBoard system can be completed within the required timeframe.

3.2.4 LEGAL FEASIBILITY

The SportsBoard system complies with legal and ethical standards related to software development. The system uses legally available open-source technologies and frameworks.

User data such as login credentials and personal information are stored securely in the database. The system does not violate any copyright or intellectual property rights.

3.3 COST BENEFIT ANALYSIS

Cost-benefit analysis evaluates the overall advantages of implementing the SportsBoard system compared to the costs involved in its development.

The main costs of the project include development time, internet usage, and basic computing resources. Since the system uses open-source software tools, financial costs are relatively low.

The benefits of the system include improved sports event management, easier access to sports information, online ticket booking, and simplified player application processes. The system also reduces manual work for organizers and improves communication between players, fans, and organizers.

Overall, the benefits of the SportsBoard system outweigh the development costs, making the project a valuable and practical solution for managing sports events digitally.

CHAPTER 4 SYSTEM DESIGN

4.1 RISK ASSESSMENT

Risk assessment is the process of identifying possible problems that may occur during the development or operation of the system and planning ways to reduce their impact. In the SportsBoard system, several risks may arise related to technical issues, system performance, data security, and external services.

One possible risk is technical failure, such as errors in the system code or database issues that may interrupt system functionality. Proper testing and debugging during development help minimize this risk.

Another risk is dependency on third-party services. The SportsBoard system uses external platforms such as Khalti for online payment and Hamro Khelkud for sports news updates. If these external services experience downtime or change their content structure, some features of the system may not work properly.

Data security risks may also occur if user information is not properly protected. Implementing secure authentication, password protection, and database security measures can help prevent unauthorized access.

There is also a risk of inaccurate or outdated information if event organizers do not regularly update sports events, schedules, or announcements. Regular monitoring and system management by administrators can help ensure that the information remains accurate.

By identifying these risks early and applying preventive measures, the SportsBoard system can maintain reliable performance and provide a secure platform for sports event management.

4.2 RMMM Table

The RMMM (Risk Mitigation, Monitoring, and Management) table describes possible risks in the project and the strategies used to reduce and manage them.

Risk	Probability	Impact	Mitigation Strategy
System Box or software errors	Medium	High	Perform regular testing and debugging during development.
Failure of online payment service	Low	Medium	Provide payment verification and allow retry options for transactions.
Data Security issues	Low	High	Implement secure authentication and database protection.
Internet Connectivity problems	Medium	Medium	Ensure the system can handle request retries and stable hosting.
Lack of regular updates from organizers	Medium	Medium	Admin monitoring and notifications for organizers to update event information.
Server down time or technical issues	Low	High	Use reliable hosting servicesand maintain system backups.
News API or service unavailable (Hamro Khelkud)	Medium	Medium	Use fallback news data or allow manual news posting by admin.

Table1 RMMM Table

The RMMM plan helps developers and administrators identify potential risks early and apply proper strategies to reduce their impact on the system.

CHAPTER 5 SYSTEM MODELLING

5.1 FLOWCHART

The system workflow of SportsBoard is explained using flowcharts for three main modules: User, Organizer, and Administrator.

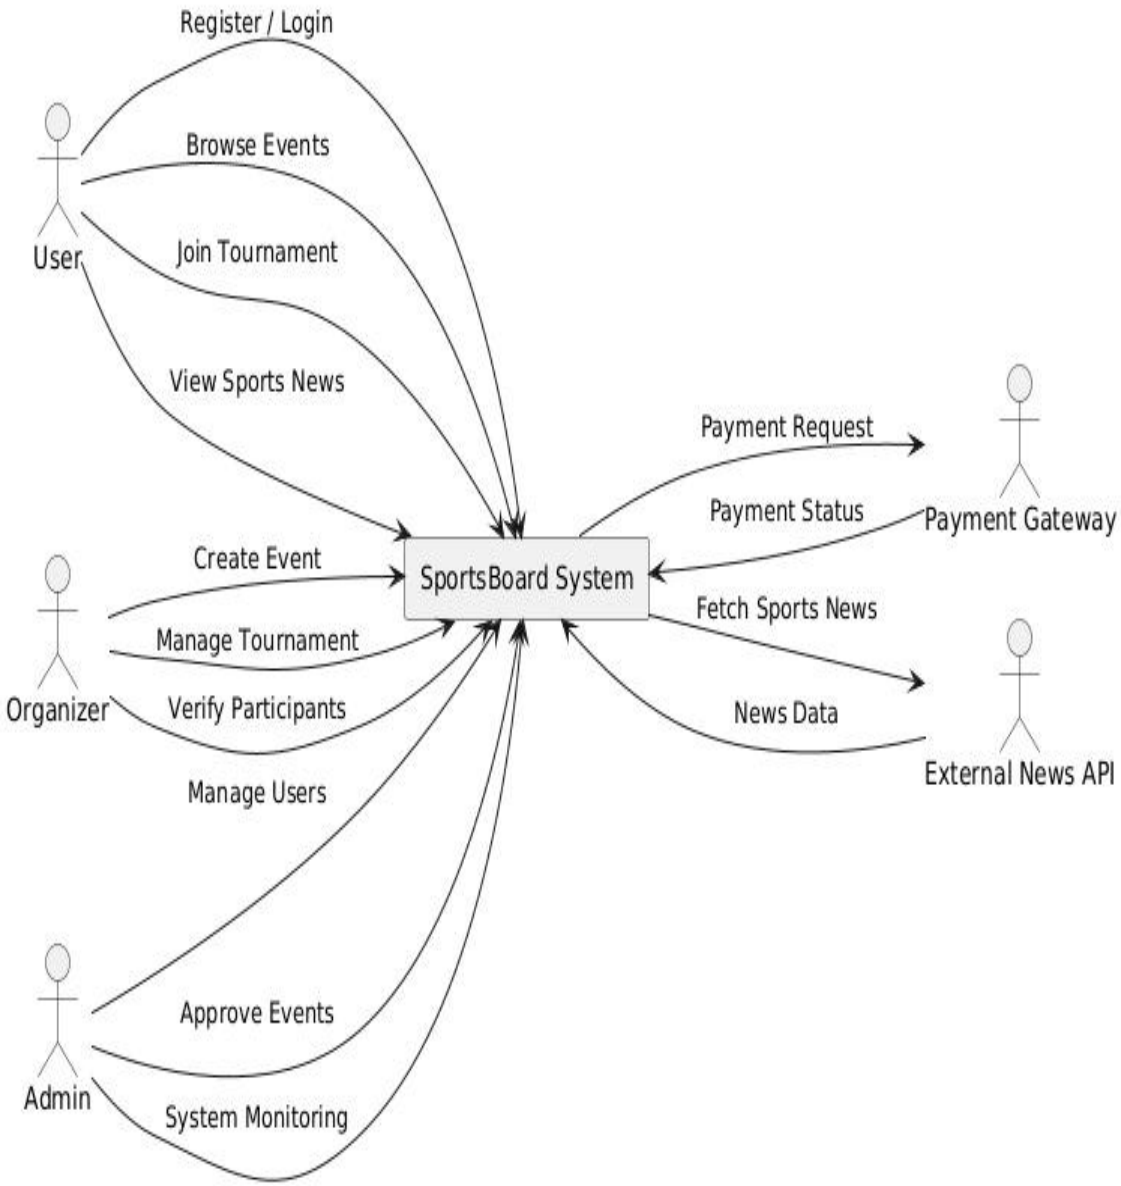

Figure8 Level-0 DFD of SportsBoard

5.6 DATABASE DESIGN

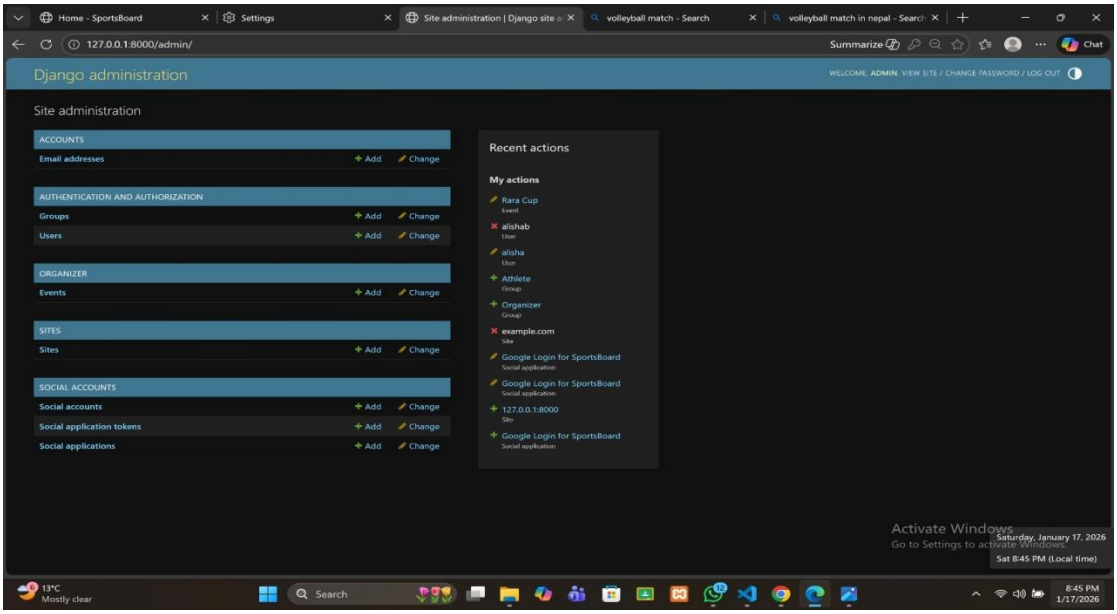

Table2 Database Table of SportsBoard

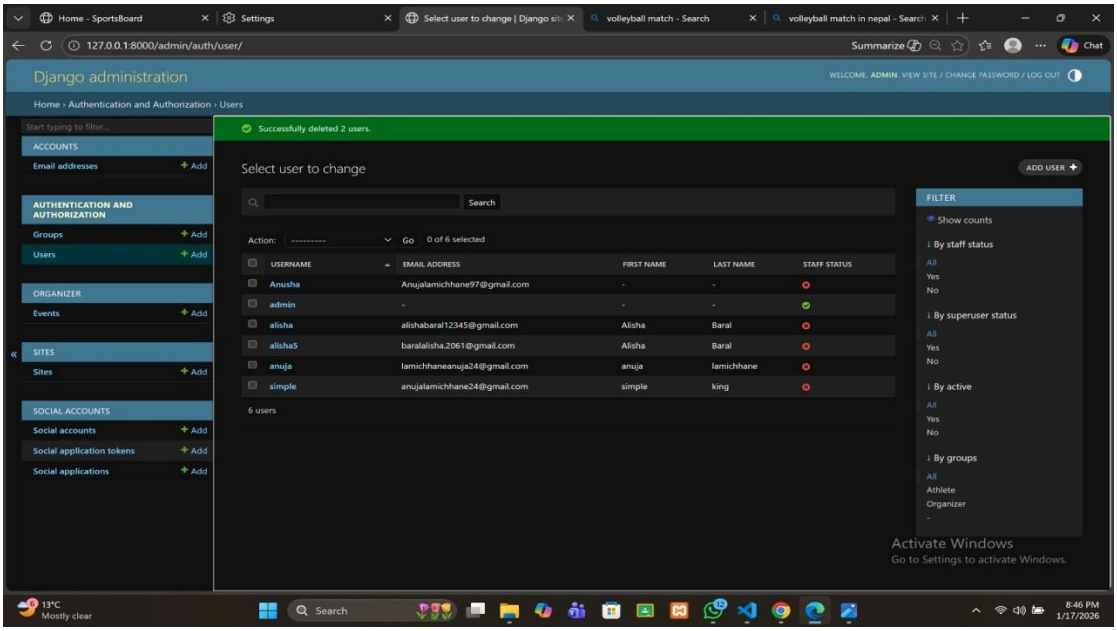

Table3 Database Table of User

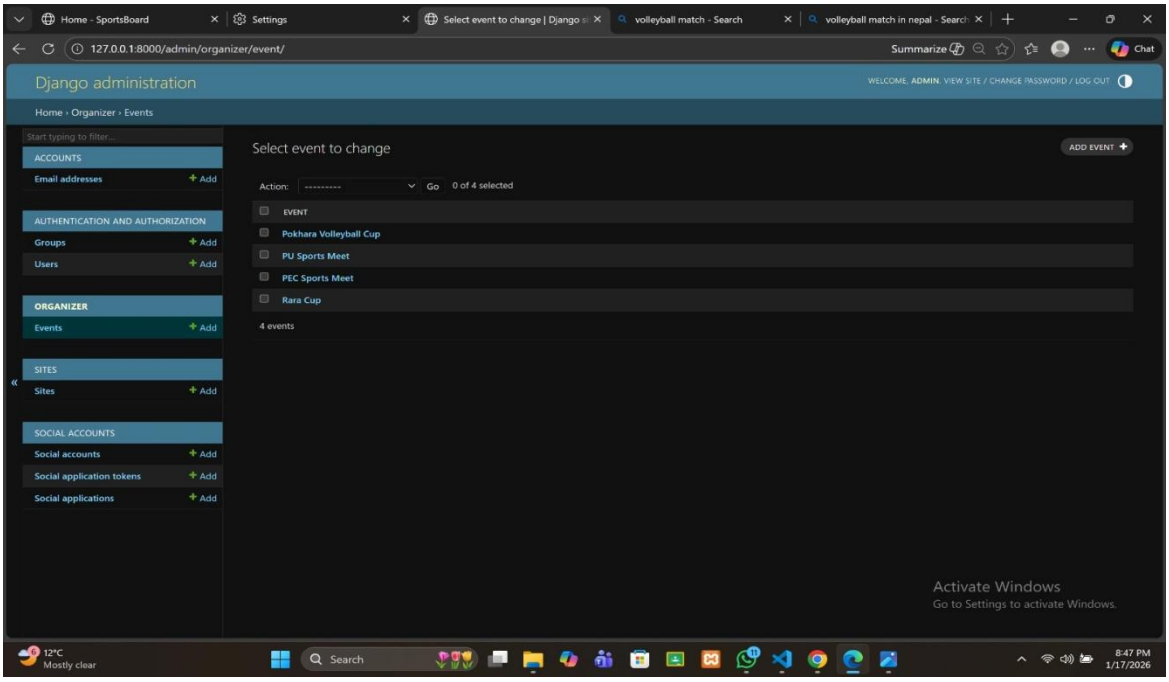

Table4 Database Table of Event

CHAPTER 6 CODING

6.1 HARDWARE SPECIFICATION

The development and testing of the SportsBoard system were performed using a standard personal computer with moderate hardware configuration. The system does not require high-end hardware resources and can run efficiently on commonly available computers.

The hardware configuration used for development includes an Intel Core i3 or higher processor, 4GB to 8GB RAM, and sufficient storage space for project files and the database. A stable internet connection is also required for accessing external services such as payment gateways and sports news platforms.

6.2 PLATFORM

The SportsBoard system is developed as a web-based platform that can be accessed through modern web browsers. The system runs on a local development server during development and can later be deployed to a web hosting server.

The application is built using the Python-based web framework Django, which handles server-side processing, routing, and database interaction.

6.3 TOOLS USED

Several development tools and technologies were used during the implementation of the SportsBoard system. These tools helped in writing code, managing the database, and testing the system.

6.3.1 PROGRAMMING LANGUAGE USED

The main programming language used in the project is Python, which is widely used for web application development. Python provides a clean syntax and strong community support, making it suitable for building scalable applications using frameworks such as Django.

6.3.2 FRONTEND TECHNOLOGIES

The frontend interface of the SportsBoard system is developed using standard web technologies. These technologies help create interactive and responsive web pages for users.

The frontend technologies include:

HTML (HyperText Markup Language) for structuring web pages.

CSS (Cascading Style Sheets) for styling and layout design.

JavaScript for client-side interaction and dynamic content.

These technologies ensure that the system provides a user-friendly interface for players, organizers, and administrators.

6.3.3 BACKEND TECHNOLOGIES

The backend of the system is implemented using the Django web framework. Django follows the Model–View–Template (MVT) architecture, which separates the application logic, data handling, and user interface.

The backend handles user authentication, event management, ticket booking, and data processing. Django also provides built-in security features such as protection against SQL injection and cross-site scripting.

6.3.4 DATABASE

The SportsBoard system uses SQLite as the database management system during development. SQLite stores all system data such as user information, event details, ticket bookings, player applications, and news updates.

SQLite is lightweight and easy to integrate with Django, making it suitable for small to medium web applications.

6.3.5 AUTHENTICATION & AUTHORIZATION

The system uses the built-in authentication system provided by Django to manage user login and account security.

Role-based authorization is implemented to control system access. Different roles such as user, organizer, and admin have different permissions. For example, users can view events and book tickets, organizers can manage events, and administrators can manage the entire system.

6.3.6 DATA PROCESSING & UTILITIES

The system uses Python libraries and Django utilities to process and manage data efficiently. These utilities help in handling form submissions, validating user inputs, and managing database queries.

Additionally, the system integrates online payment verification using services such as Khalti to process ticket booking payments.

6.3.7 LOCATION SERVICES

Currently, the SportsBoard system does not use advanced location-based services. However, event location details are stored in the database and displayed to users so that they can easily identify where sports events are being held.

Future versions of the system may integrate map services to display event venues and navigation information.

CHAPTER 7 TESTING

Testing is performed to ensure that the SportsBoard system works correctly and meets user requirements. Two main testing methods used in this project are Black Box Testing and White Box Testing.

Black Box Testing:

Black box testing checks the system functionality without looking at the internal code. The tester verifies whether the system gives correct output for given inputs. In SportsBoard, features like user registration, login, event application, ticket booking, and payment verification were tested to ensure they work properly.

White Box Testing:

White box testing focuses on testing the internal structure and code of the system. The developer checks the program logic, conditions, and database operations. In SportsBoard, backend processes such as authentication, database queries, role management, and payment verification were tested to ensure the system works efficiently.

7.1 TABLE PRESENTING TESTING ACTIVITIES AND TEST RESULTS

The following table summarizes the testing activities performed during the development of the SportsBoard system and the results obtained.

S.N.	Test Case	Description	Expected Result	Actual Result	Status
1.	User Registration	User creates a new account in the system.	User accounts should be successfully created.	Account created successfully.	Pass
2.	User Login	User logs into the system with valid credentials.	User should access the dashboard.	Login successful.	Pass

3.	Event Viewing	User views available sports events.	Event should be displayed correctly.	Event displayed properly.	Pass
4.	Player Application	User submits a player application form.	Application should be stored in database.	Application submitted successfully.	Pass
5.	Ticket Booking	User books tickets for an event.	Ticket booking should be confirmed.	Ticket booking successful.	Pass
6.	Online Payment	Payment proceed through Khalti.	Payment should be verified and confirmed.	Payment verified successfully.	Pass
7.	Organizer Event Management	Organizer creates and update sports events.	Event detail should be saved in database.	Event created and updated successfully.	Pass
8.	News Display	Sports news fetched from Hamro Khelkud.	Latest sports news should be displayed.	News displayed successfully.	Pass
9.	Admin Management	Admin manages user, organizer and events.	Admin should control system activities.	Admin functions working correctly.	Pass

Table5 Testing Table

CHAPTER 8 PROJECT SCHEDULE

The development of the SportsBoard system followed a structured schedule to ensure the successful completion of the project within the given academic timeline. The project activities were divided into different phases including problem identification, literature review, system design, implementation, testing, and documentation.

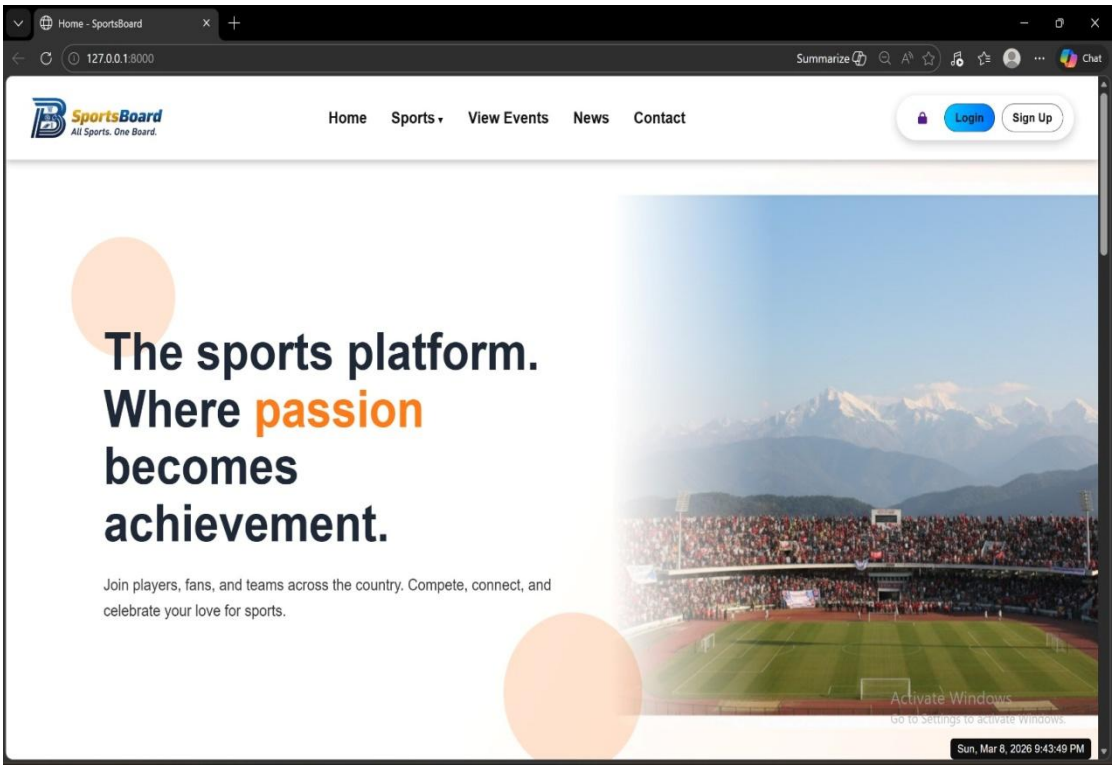

Each phase of the project was planned and completed within a specific time period. Proper planning helped the project team manage time efficiently and ensure that every stage of the system development lifecycle was completed systematically.

CHAPTER 10 CONCLUSION

The SportsBoard system was developed to provide a centralized digital platform for managing sports-related information, events, and participation. The system connects organizers, athletes, and users by allowing organizers to publish sports notices, conduct player trials, and manage tournaments while enabling users to apply for events and book tickets online. This platform helps simplify the process of sports event management and improves communication between sports organizations and participants.

The project successfully demonstrates how information systems can improve sports management through digital event announcements, online applications, and ticket booking services. Additionally, the system integrates external sports news from a third-party service to keep users updated about sports activities. By automating these processes, the platform reduces manual work and increases efficiency in sports event coordination.

Overall, the SportsBoard system addresses the lack of a unified sports management platform in the local context. The project shows that a web-based system can significantly enhance accessibility, transparency, and organization of sports activities. In the future, the system can be expanded with additional features such as mobile application support, advanced analytics, and real-time sports updates, making it a more comprehensive digital sports ecosystem.
